

Course and Pattern of Cingulate Pathology in Schizophrenia

Francine M. Benes, Miles G. Cunningham,
Sabina Beretta, and Barbara Gisabella

Chapter contents

Goals of this Chapter 680

The Corticolimbic System and Symptoms of Schizophrenia 681

- Affectivity 681
- Selective Attention 682
- Motivation 682
- Sociability 683
- Logical Processing 683

Does Anterior Cingulate Cortex Play a General Role in Psychopathology? 683

Postmortem Studies of Cingulate Cortex in Schizophrenia and Bipolar Disorder 684

- Microscopic Evidence for a GABA Defect in ACC in Schizophrenia 684
- Dopamine Inputs to GABA Cells in Schizophrenia 686
- Evidence for Glutamatergic Dysfunction 686
- Model for Altered Neural Circuitry in ACC of Schizophrenics 686

Potential Influence of Pre- and Postnatal Stress on Cingulate Circuitry in Schizophrenia 689

Postnatal Development of ACC and the Onset of Schizophrenia 690

GABA System 691

Ingrowth of AmygdaloCingulate Projections 692

Dopamine System 693

Development of Dopamine–GABA Interactions in Cingulate Cortex 695

Convergence of Serotonin and Dopamine Fibers on Cortical Neurons 696

Influence of Serotonergic Fibers on the Cortical Dopamine Innervation 696

Influence of Dopamine Fibers on the Cortical Serotonergic Innervation 697

Mis-Wiring of Cingulate Circuits as a Pathological Substrate of Schizophrenia 699
